

## BACKEND INSTRUCTOR ASSESSMENT

Create an application using Django and Django rest framework extending Django's auth system and using Djoser and JWTokens for authentication. It provides an API for a simple discussion service (discussion forum with a single thread). The API clients can:

1. Create a post
2. Get a list of posts ordered by date of creation, information about the number of likes, date of creation, and users who liked a post should be included in the response.
3. Edit a post created by the authenticated user.
4. Delete a post created by the authenticated user.
5. Like another user's post.

API should have documentation and the project should be hosted on Heroku.

Please submit the source code of the application to a public git repository using Github and the Heroku link.
